

Please consider the following:

1. Create 1 route with an input box accepting a financial number such as “250k”, “10m”, or “.5b”.
2. Create 1 other route for displaying the output in full such as “250,000”, “10,000,000” or “500,000,000” respectively.

This challenge should be written using Angular. We recommend using `ng new` but feel free to use any seed you'd like. The challenge should be time boxed to 4 hours. No effort on design is necessary. We will be paying the most attention to component structure, input validation, passing data between routes, and unit tests. However, we will still be evaluating style, code hygiene, and overall pattern decisions.

You may be asked to extend your take home over a screen share during the interview.
